**Title: No shapes found in file – error message****Gerber FastFact #:** 3531**Supplied By:** Technical Systems Support**Last Modified:** December 18, 2001**Summary:** When outputting a job from Composer or opening a job directly in GSPPlot, you may receive the error message "No shapes found in file"

---

This error message will occur when the plot file contains no shapes that can be output to either a plotter or an imaging device. Creating a plot file that contains only an Image Template with no color fills assigned can cause this error.

To resolve this situation, use the Image Fill tool in the Composer program to change the color assignment of the Image from Template to either Spot or Process.

Once set, the Image Fill Color Type can be saved as a preference so that Images that are imported in the future will automatically have a color Fill assigned.
