Summary: This document describes how the Gerber EDGE and Gerber EDGE2 can work for you even if you do not own Gerber software.

Underlined text indicates change from the previous document.

Drive the Gerber EDGE or EDGE2 from various software programs.

The Gerber EDGE and EDGE2 can be driven directly from programs such as Scanvec Inspire-Pro®, Amiable FlexiSIGN-PRO™ and CadLink SignLab®. The programs do not need the .GAD file as it has previously.

This is how the process works:

- First, a user designs their job in Inspire-Pro, Flexi-SIGN-PRO or SignLab.
- Secondly, the user then starts the programs' output or RIP modules and selects the Gerber EDGE or EDGE2 as the desired output device.
- Finally, the user prints to the Gerber EDGE or EDGE2.

Contact Scanvec Corp., Amiable Technologies or Cadlink for more information about which EDGE and EDGE2 functions are supported, and for details about required software levels and necessary options.
